

Become part of New York's invasive species early detection network by learning how to use iMapInvasives, an online mapping system shared by citizen scientists, educators, and natural resource professionals. All interested groups are encouraged to help keep the map up-to-date and accurate by reporting invasive species locations and control efforts. You can even use your smartphone to report new findings. The NY Natural Heritage Program will offer free sessions throughout the state this spring, with beginner and advanced levels, plus identification sessions at some of the locations. Visit www.nyimainvasives.org for schedule details and registration, and contact imainvasives@nynhp.org with general questions.
